STUDY DESCRIPTION:

This study will use an open-ended, electronic, online survey instrument that students in Georgetown and other universities can use to share their experiences with COVID-19. As there is little existing information on how students are experiencing the pandemic and the strategies they have adopted, the survey will provide exploratory information on various aspects of the student experience.

Objectives: The survey will serve as a public good that (a) provides students an entirely voluntary way to share their experiences; (b) produces information that may be useful for administrators and leadership in universities and; (c) reduces the workload for faculty members by providing a common platform to collect student views.

Survey: The survey does not collect any identifying information from the respondent, and all questions are voluntary. We have deliberately not included any type of question that could be used to identify a person, and neither the questionnaire nor the process of data collection will permit any private identifying information to be obtained. The survey also requires explicit consent and self-identification as being 18+ years old at the beginning. The questionnaire has been attached with the submission.

Publication: Once the survey numbers have exceeded a threshold, we will put the results on a public dashboard, through *gui²de*'s website on Georgetown University domains.

Data Management: We will continue to follow all the best practices with regard to the maintenance of the data. We are using SurveyCTO for this, and their servers and security are both GPDR and IRB compliant. Downloaded data will be stored on Georgetown University encrypted Box folder via *gui2de*. Data handling code will be stored on Github repositories.
